

# White Paper XXX

## **Experimento de Transmisión Global de Intención sobre el Autismo: Parte I**

### **A los cuatro meses de un programa de doce**

por

W.A. Tiller, Ph.D., S. Miller, M.Ed., C.C.C. and C.R. Reed, Ph.D. and J. Yotopoulos

#### **Resumen**

**Objetivos:** Los objetivos de este estudio de un año en el punto de 4 meses fueron:

- (1) Transmitir información simultánea y globalmente en forma de intenciones específicas a cuarenta y cuatro niños diagnosticados con autismo y sus padres ubicados físicamente en las direcciones de sus correos postales, alrededor del mundo;
- (2) apoyar de manera significativa la integración de estos niños en el funcionamiento del espacio-tiempo y reducir y/o eliminar el estrés de los padres durante este proceso de transformación y
- (3) permitir que ocurran estos cambios humanos beneficiosos a un costo notablemente reducido.

#### **Diseño:**

Se pidió a cada padre que completara un test de Zung (Lista de chequeo para la auto evaluación del nivel de ansiedad y depresión) y una ATEC (Lista de chequeo para la evaluación del tratamiento del autismo en niños) como referencia. Los padres también envían mensualmente formularios de Zung y ATEC, tanto de forma anecdótica como trazados de nivel de 4 meses, que se presentan mas adelante resumidos de forma estadística. Nuestro análisis se divide en los siguientes grupos de edad: Nacimiento a 3 años, 4-7 años, 8-12 años, 13-20 años y mayores de 20 años.

#### **Resultados:**

- (1) La fecha de inicio de emisión fue el 12/03/2012. El 12/04/2012, un niño australiano de 3 años no verbal, durmió completamente toda la noche, dijo 20 palabras inteligibles ese día en la secuencia apropiada. El 12/04/2012, sonrió alegremente a su madre y la miró a los ojos, y
- (2) se han graficado los resultados para las 90 preguntas que incluye la lista de verificación de la evaluación del tratamiento del autismo, para todos los niños, cada mes, desde el inicio del experimento, y esos gráficos muestran tendencias visuales muy notables. Incluso sin estadísticas, los niños, los padres y los investigadores están encantados con estos resultados.

#### **Conclusiones:**

Se concluyó lo siguiente a partir del estudio realizado luego de 4 meses:

- (1) La transmisión global desde un sitio en particular en Arizona, hacia Australia y otros sitios distantes, usando solo un nombre y una dirección a la vez, los cuales eran desplegados en la pantalla de una computadora ubicada dentro de un espacio experimental, el cual fue

"condicionado" mediante un dispositivo almacenador de intención (IHD), produjo resultados robustos y exitosos.

(2) los costos financieros de este procedimiento tienen un orden de magnitud menor que los procedimientos de tratamiento estándar.

## **Introducción**

Como antecedente, hay que decir que la investigación sobre la intención del grupo de Tiller comenzó a principios de la década de 1970 y alcanzó un nivel significativo a mediados de la década de 1990 (1). La financiación filantrópica significativa, entre 1997 y 2003, llevó al desarrollo de nuestro primer dispositivo de intención (IHD / IIED), un circuito eléctrico simple que podría albergar una Intención cuando se imprime desde un estado meditativo profundo (2). Con la ayuda de este IHD, pudimos cambiar meta establemente las propiedades físicas de los materiales, inorgánicos y orgánicos, vivos y no vivos. También pudimos demostrar inequívocamente que la suposición de Descartes en los años 1600 dC, según la cual "las cualidades conciencia e intención humanas no pueden influir significativamente en un experimento objetivo y bien diseñado sobre la realidad física", es absolutamente errónea en el mundo de hoy.

El experimento de replicación del Cambio de Una Unidad de pH ( $\Delta\text{pH} = + 1$ ), publicado principalmente en JACM (3-10), introdujo nuestro trabajo a los lectores de esa revista. A partir de ahí, el siguiente paso que dimos fue aprender a transmitir una intención específica a grandes distancias.

Nuestro primer experimento de transmisión comenzó en 2003 y se completó en 2005 (11, 12). Cindy R. Reed era una estudiante graduada en el Holos University Graduate Seminary, en Missouri, cuando el Dr. Tiller comenzó a discutir con ella (en 2002) la posibilidad de utilizar su tecnología IHD, como un vehículo de investigación para obtener un título de Doctor en Teología de Holos. En 2005, a Cindy se le otorgó el título luego de escribir una tesis excepcional titulada "Los efectos de la intención en la disminución de la ansiedad y la depresión, usando dispositivos impresos con intención (IHD).

En resumen, dos experimentos, uno de ellos tipo doble ciego, se realizaron en sujetos humanos adultos en Pennsylvania, EE. UU. Y en Guelph, Canadá, mediante la transmisión de intención desde un sitio cerca de Springfield, Missouri. Los sujetos del experimento, originalmente alrededor de 500, se dividieron en dos grupos, con información demográfica de cada uno ingresada en una de las dos computadoras usadas en el procedimiento. El IHD fue impreso por un equipo de cuatro meditadores experimentados con una intención específica, que era mejorar la salud, disminuir la ansiedad y disminuir la depresión de los sujetos de los experimentos. Los nombres y direcciones del grupo de intervención se desplegaron continuamente en la pantalla de una computadora ubicada cerca de un IHD que transmitía la intención específica. En una ubicación separada, en Cedar Rapids, Iowa, los datos demográficos del grupo de control, se desplegaban continuamente en la pantalla de otra computadora, sin que hubiese un IHD con ningún tipo de intención asociado a ella. Se hicieron intervenciones y recolecciones de datos en intervalos de tres meses y ocho meses (11, 12).

Los resultados se compararon mediante un análisis mixto de varianza con un factor entre grupos y otro dentro de los grupos, comparando las puntuaciones previas y posteriores a la prueba, según el test "Inventario de Estado-Rasgo de Ansiedad para adultos" (STAI Y1 y Y2) y la escala de Zung para la Autoevaluación de la Depresión. Los resultados para el grupo de tres meses, mostraron una reducción marginalmente significativa en el STAI Y1 para el grupo de intervención,

con un nivel de significancia de 0.089. El grupo de control no mostró variación significativa. El análisis de los puntajes previos y posteriores a la intervención, luego de la recolección de los datos grupales de tres y ocho meses, mostró una reducción significativa: Estado de Ansiedad ( $p < 0,003$ ), Rasgo de Ansiedad ( $p < 0,000$ ) y Depresión ( $p < 0,001$ ). Estos resultados sugieren que, con el tiempo, la transmisión de IHD a sujetos adultos puede tener un impacto significativo en sus episodios de ansiedad y depresión (11, 12).

Lo anterior (más otro experimento exitoso de transmisión desde Payson, Arizona hasta Berlín, Alemania, para un cambio de pH;  $\Delta pH = + 1.5$ ) nos brindó la confianza para intentar la transmisión global actual de un año, para el experimento de intención sobre el autismo.

### **Experimento de Intención sobre el Autismo**

Técnicamente, utilizamos dos cobertizos a unos 100 pies de distancia, en la propiedad de 2.6 acres del Dr. Tiller, en Payson, Arizona. Uno fue usado para transmitir la intención asociada a los niños y el otro para transmitir la asociada a los padres. Cada cobertizo contenía su propio IHD impreso especialmente con su propia declaración de intención, más una computadora en la cual se desplegaba continuamente la lista de los 44 nombres y direcciones. El tiempo de un ciclo completo de despliegue de cada lista era de 44 minutos, por lo que cada nombre y dirección se exponían durante 1 minuto por ciclo. El IHD se reimprimió cada 3 meses, a lo largo de el año que duró este experimento.

Durante este experimento, dos declaraciones de intención claras y coherentes se transmitieron simultáneamente, una a los niños y otra a sus padres, ubicados en diversos lugares de la tierra. Esto altera significativamente el contenido de información y el contenido de energía sutil de su espacio en el hogar. El objetivo de sus intenciones específicas de impresión es:

(1) apoyar la integración de estos niños diagnosticados con autismo para que puedan funcionar más fácilmente aquí en el espacio-tiempo, de acuerdo con el propósito de su alma para la experiencia de su tiempo de vida y

(2) apoyar a los padres de estos niños para que puedan reducir y/o eliminar fácilmente su estrés diario relacionado con la crianza amorosa de estos niños, en esta aventura conjunta.

### **Recopilación de Datos**

Se requirió que cada padre completara un formulario Zung y un formulario ATEC, para establecer una línea de base. Dos IHD se imprimieron el 12/03/2012 y se pusieron en servicio en sus cobertizos respectivos, el mismo día. También se solicitó a los padres que presentasen formularios mensuales de Zung y ATEC, para poder monitorear su progreso de forma anecdótica y estadística. El análisis estadístico se iniciará en la etapa de reimpresión, a los 6 meses, y estará disponible en la Parte II de esta serie de reportes.

La edad del niño es significativa, ya que la mayoría de las investigaciones médicas y educativas actuales, sugieren que los niños diagnosticados con autismo, tienen un progreso limitado o nulo en las área de la comunicación y la socialización, después de los siete años. Debido a esto, nuestro análisis se divide en los siguientes grupos de edad: desde el nacimiento hasta los 3 años, de 4 a 7 años, de 13 a 20 años y, mayores de 20 años. En este grupo de 44, solo hay 12 niños que tienen edades comprendidas entre el nacimiento y los 7 años. Los otros 32 son mayores de 8 años.

## Progreso a la fecha (13)

Aunque hay una gran cantidad de datos anecdóticos maravillosos de los padres más algunos de los propios niños, aquí solo hay espacio para presentar algunos fragmentos:

- Durante el primer día del experimento, este niño no-verbal de 3 años, dijo aproximadamente 20 palabras diferentes. Estas palabras estaban en el contexto perfecto. Un ejemplo perfecto fue cuando su hermana mayor le dio una manzana, tomó la manzana y dijo claramente "gracias". No podíamos creer lo que estábamos escuchando, era simplemente increíble. Duerme la mayoría de las noches sin despertarse. Mejoró en el afecto, las ganas de acurrucarse o sentarse en el regazo, aprendió una nueva habilidad, la de soplar besos y, en general, tratar de interactuar más con los miembros de la familia. Los dos niños mayores en el mismo hogar, que también estaban diagnosticados con autismo, aunque no estaban incluidos oficialmente en el experimento, también han mostrado mejoras significativas en el período de 4 meses, según el informe de los padres. Ambos parecen estar más conscientes de sus habilidades y dones, están felices y han pedido ser parte del próximo experimento, ya que han visto una gran mejora en su hermana menor.

- Muchos de nosotros (padres, terapeutas, etc.) hemos notado mejora en el lenguaje. Incluso más palabras y/o nombres de dos sílabas. El aumento en el lenguaje es el cambio más obvio que hemos presenciado. Desde el inicio de este experimento de intención, el 12/03/2012, los comportamientos perjudiciales han disminuido significativamente, especialmente la agresión hacia nosotros y los voluntarios en el programa. Definitivamente hay una nueva calma en la casa.

- Unos padres informaron que su hijo usó la comunicación asistida o ayudada, desde el 12/03/2012. Me he enterado de que Ethan (10 años) tiene "conocimientos" sobre situaciones y personas sobre las cuales nunca le he dicho nada directamente. Le pregunté si conocía a mi amiga, Suzy Miller y sobre mi trabajo con ella, y él escribió:

"Yo también estoy complacido... solo por sentir el amor que enseña Suzy. Ella les da a los sanadores una buena sensación... el buen corazón... ella habla "con los amigos que eres"... por favor, dale a mis amigos del corazón las gracias, y buen corazón y buena sensación. Sí, ella y yo sentimos que tu aprenderás de mi autismo.

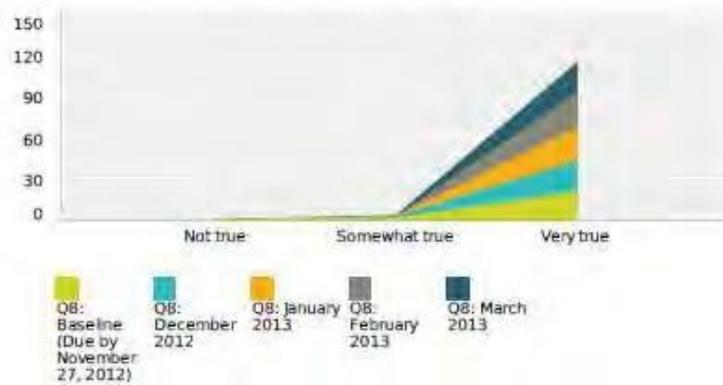

- Una mujer de 31 años, no-verbal, usando comunicación asistida, dijo: Lo que puedo decir es que mi cerebro está recibiendo un programa de operación totalmente nuevo. Por lo poco que he avanzado en su desarrollo, es muy emocionante hasta ahora. Estoy preguntando cuál es su significado para mí y quizás para otros mas adelante. La parte emocionante es cuán vivo se siente mi cerebro y lo divertido que es estar más consciente. "¡Hoy me desperté y me sorprendí! Mis ojos están empezando a ver en (de una) forma como nunca antes. El alma es (ocupa) mucho más en mi cuerpo. La visión sólida será increíble de ver. No (estoy) aquí aún, pero (es un) gran salto en esa dirección ". "Puedo relacionar el tacto y la visión, ahora. Veo tela y la toco, para hacer que dos sentidos se unan. ¡Puedo ver la textura y saber cómo se siente ahora!

- Los 77 ejemplos de gráficos de datos siguientes se recopilaron en este período de 4 meses. Se explican por sí solos, así que no se han agregado leyendas aclaratorias.

<b>Q8: February 2013</b>	19.23% 5	30.77% 8	38.46% 10	11.54% 3	26
<b>Q8: March 2013</b>	16% 4	32% 8	32% 8	20% 5	25
Total Respondents	29	38	38	18	123

## **Conclusiones**

1. La transmisión global desde nuestro sitio de Arizona a lugares cercanos y muy distantes en la tierra ha sido exitosa;
2. En el nivel de cuatro meses, tanto los niños como los padres están contentos con los resultados positivos experimentados hasta la fecha y
3. Los costos financieros anuales por familia son menores que los incurridos con sus propios costos anuales de teléfono celular.
